Charring is the oxidation of hot melt adhesive at elevated temperatures due to prolonged and repeated heating. Charring is more pronounced at temperatures exceeding 200° Centigrade.

Charred material will not dissolve in any solvent nor can it be remelted. Charred product will coat hoses and nozzles, damaging the equipment.

.100 Engagement

A cartoon illustration of a green worm with a smiling face, standing on top of a thick red book. The worm has its arms raised in a celebratory gesture. The book is shown from a three-quarter perspective, revealing its white pages and a black bookmark sticking out from the bottom. The background is a soft, yellowish glow.

Our nozzle inserts are stainless steel hydraulic tubing and come in 5 different lengths. This tubing helps create a smooth, unrestricted flow of hot melt.

An Engagement is...

the length of the selected orifice and can vary between 0.050" (1.2mm) and 0.300" (7.6mm). A nozzle's engagement can have a significant affect on the flow rate of hot melt through the nozzle.

Typically, longer engagements will decrease adhesive flow.

Not Getting A Clean Shut Off?

A clogged muffler/silencer can cause a module to have a poor shut off. A typical symptom would be glue stringing (angel hair). Before you replace the module and/or nozzle, check the muffler/silencer on the solenoid valve for excess oil or build up.
